Are you an iPhone enthusiast? Can you not stop Facebook-ing, Tweeting, surfing, navigating and doing all the other various activities that can be completed via iOS? If so, you'll likely realize that your addiction has an unknown victim—your battery. Do you know the only way to actually get the advertised battery life of your iPhone? *Turn it off*. For those of us who rely on the iPhone as a multi-use tool for navigating, working, and actually communicating it's important to have a full battery virtually all the time. unfortunately that's not realistic unless you have one of the many external battery cases on the market. We decided to check out the Mophie Juice Pack Air, why? I'll be honest, it was at Best Buy, it looked good, and it's relatively small for the power that it provides to your phone—oh and Mophie is one of the premier companies when it comes to iPhone accesories.

The Juice Pack air simply slides over your iPhone 4/4S and provides a Micro USB connection for external charging. While some dislike this because it means you need to get another charger to carry around with you, I actually like it. It means that you now have double the potential to charge your phone whenever you see a charger: the odds are that if you can't find an Apple dock connector, you'll be able to find the industry standard Micro-USB plug.

The Mophie Juice Pack Air is relatively slim and includes cutouts for the power buttons and headphone jack. The hole for the headphone jack is quite generous, bit some may have issues with headphones that use a large plug since it is not flush against the iPhone.

A series of 4 LED's on the bottom of the case allows you to check the battery level of the case separately from your phone. A small rocker switch to the left side of the case in this image selects if you'd like the phone to be charging from the case, or used purely as reserve.

For the full specifications of the Mophie Juice Pack Air, check them out on the web here. [link]
